

## BUILDER EDITION - ASSIGNMENT FEEDBACK

# Session 02 - Numbers, Conversions & Talking to Users - Assignment S02\_A01

Student: Aanya

Module 1 - Programming Foundations

Graded: 01 Aug 2026

Pass mark: 50/100

SCORE

# 94 / 100

Bonus not attempted

## Excellent - all five correct

Every answer runs and produces the right result, including the change-making program.

94% - well above the 50% pass line

## MARKS BREAKDOWN, QUESTION BY QUESTION

| Q  | What it tested                 | Level | Score   | Feedback                                                                                                                                                      |
|----|--------------------------------|-------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Q1 | int() + arithmetic             | EASY  | 16 / 20 | Correct (200). Small thing: the first line <code>int("185") + 15</code> computes a value then throws it away - just print it once, or store it in a variable. |
| Q2 | Floor // and modulo %          | MED   | 18 / 20 | 71 whole eggs, 3 remaining - correct and nicely labelled. Same tidy-up: the bare <code>500 // 7</code> line above the print does nothing.                     |
| Q3 | Comparison + logical operators | MED   | 20 / 20 | All three booleans correct, including the combined <code>and</code> condition. Perfect.                                                                       |
| Q4 | f-string for change            | EASY  | 20 / 20 | Clean f-string, correct change of 80. Perfect.                                                                                                                |
| Q5 | Change-making with input()     | HARD  | 20 / 20 | Denomination breakdown of 1745 is exactly right (500×3, 100×2, 20×2, 5×1). Great use of // and % together.                                                    |

## WHAT YOU DID REALLY WELL

- ✓ Every program runs and gives the correct answer - including the trickier change-making logic.
- ✓ You combined `//` and `%` correctly in Q5, which is the heart of this session.
- ✓ f-strings used naturally and correctly.

## CODING PRACTICE - THE CRAFTSMAN'S CODE

- > Watch the spacing: write `print(...)` not `print (...)` - no gap before the bracket (PEP 8).
- > Avoid 'dead' lines like `500 // 7` on its own - compute a value once and print or store it.
- > Great instinct labelling your outputs ('Number of whole eggs:') - keep that.

### WHERE TO IMPROVE

- Remove the throwaway expression lines in Q1 and Q2.
- Store repeated results in a variable instead of recomputing inside print.

**YOUR TARGET FOR THE NEXT SESSION** **Very strong - 94.** You have operators and typecasting solid. Next, carry these into real data work in Stage 2, and keep tightening your formatting (no space before brackets).
